

Description

The ICS570B is a high performance Zero Delay Buffer (ZDB) which integrates ICS' proprietary analog/digital Phase Locked Loop (PLL) techniques. The ICS570B, part of ICS' ClockBlocks™ family, was designed as a performance upgrade to meet today's higher speed and lower voltage requirements. The zero delay feature means that the rising edge of the input clock aligns with the rising edges of both outputs, giving the appearance of no delay through the device. There are two outputs on the chip, one being a low-skew divide by two of the other. The device incorporates an all-chip power down/tri-state mode that stops the internal PLL and puts both outputs into a high impedance state.

The ICS570B is ideal for synchronizing outputs in a large variety of systems, from personal computers to data communications to graphics/video. By allowing off-chip feedback paths, the device can eliminate the delay through other devices.

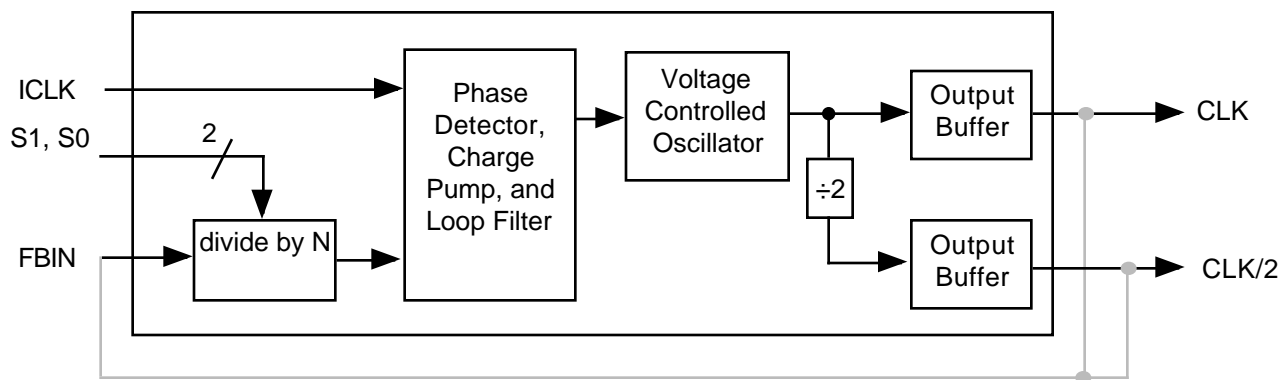

The ICS570B was done to improve input to output jitter from the original ICS570M and ICS570A versions, and is recommended for all new 3.3 V only designs.

For 5V applications, use the ICS570A.

Features

- Packaged in 8 pin SOIC.
- Pin-for-pin replacement and upgrade to ICS570/ICS570A
- Functional equivalent to AV9170 (not a pin-for-pin replacement).
- Low input to output skew of 300 ps max (>60 MHz outputs).
- Low skew (100 ps) outputs.
- Ability to choose between 14 different multipliers from 0.5X to 32X.
- Input clock frequency up to 150 MHz at 3.3V.
- Can recover degraded input clock duty cycle.
- Output clock duty cycle of 45/55.
- Power Down and Tri-State Mode.
- Full CMOS clock swings with 25mA drive capability at TTL levels.
- Advanced, low power CMOS process.
- Operating voltage of 3.3 V ($\pm 5\%$).
- Industrial temperature version available

Pin Descriptions

Number	Name	Type	Description
1	S1	I	Select 1 for output clock. Connect to GND, VDD, or float per decoding table above.
2	VDD	P	Connect to +3.3V.
3	GND	P	Connect to ground.
4	ICLK	CI	Reference clock input.
5	FBIN	CI	Feedback clock input.
6	S0	I	Select 0 for output clock. Connect to GND, VDD, or float per decoding table above.
7	CLK	O	Clock output per table above.
8	CLK/2	O	Clock output per table above. Low skew divide by two of pin 7 clock.

Key: CI = clock input, I = input, O = output, P = power supply connection

External Components

The ICS570B requires a 0.01 μ F decoupling capacitor to be connected between VDD and GND. It must be connected close to the ICS570B to minimize lead inductance. No external power supply filtering is required for this device. A 27 Ω series terminating resistor can be used next to each output pin.

**Clock Period Jitter Tables**

All jitter values are considered typical measured at 25°C with 27 Ω series termination resistor and 15pF loads on both CLK and CLK2. The feedback is from CLK2 to FBIN. Note that if an output is unused, it should be left unconnected to improve output jitter on the active output clocks.

**Recommended Circuit:****x2 Mode (S1, S0 = 1, 1)**
CLK Feedback**x2 Mode (S1, S0 = 1, 0)**
CLK/2 Feedback

Using CLK as the feedback will always result in synchronized rising edges between ICLK and CLK. However, the CLK/2 could be a falling edge compared with ICLK. Therefore, whenever possible, we recommend the use of CLK/2 feedback. This will synchronize the rising edges of all 3 clocks.
